

Manual

Introduction

Built for gaming enthusiasts and audiophiles alike, the CM Storm Sirius 5.1 Surround Sound Gaming Headset creates an immersive gaming experience with hi-fidelity soundscapes and intensified bass.

Sirius produces precise and immaculate sound through its 4 discrete channels of center, front, rear, and subwoofer; delivering accurate real-time 360 degree audio that is fully adjustable through its tactical mixing console. In addition, Sirius is coupled with a retractable microphone with background noise cancellation that enables crystal clear conversations with teammates and enemy combatants.

Package Content

- ◆ Sirius Gaming Headset
- ◆ Tactical Mixing Console
- ◆ Second Set of Ear Pads
- ◆ Driver CD
- ◆ 3.5mm Audio Jack cable bundle
- ◆ Quick Start Guide

System Requirements

- ◆ A PC with at least one free USB 2.0 port
- ◆ Windows® XP SP2 or higher
- ◆ Works best with applications that support DirectX 9.0c or higher
- ◆ Microsoft .Net 3.5 SP1 (XP/Vista only)

Technical Information

Headphones

- Transducer principle: Dynamic closed
- True 5.1 surround sound
- Ear coupling: Circumaural
- Ear cushions: Detachable micro fiber & leatherette
- Frequency Response: 10Hz – 20,000Hz
- Impedance: F/R/C: 32 Ohms Sub: 16 Ohms
- Sensitivity: >105dB
- Driver: F/R/C: 30mm Sub: 40mm
- Distortion: Less than 1%

Microphone

- Retractable Microphone with LED mute indicator
- Frequency Response: 100Hz – 10,000 Hz
- Impedance: 2.2k Ohms
- Sensitivity: -46 dB ±3dB

Installation

The CM Storm Sirius True 5.1 Surround Sound Gaming Headset can be used in two modes:

1. 3.5 mm Audio Jacks + USB (power)

All connectors feature standard soundcard color coding to simplify the process of connecting Sirius to your Soundcard or the Mainboards on-board Soundchip.

Headset Connector Marking	Soundcard Socket
■ Pink (3.5mm jack)	Microphone
■ Orange (3.5mm jack)	Subwoofer and Center
■ Black (3.5mm jack)	Rear Speaker (right and left)
■ Green (3.5mm jack)	Front Speaker (right and left)
■ Black USB Plug	USB Port for Power

2. Tactical Mixing Console (Dual USB)

Sirius can operate in two modes: It can either receive its signals from your 5.1 soundcard or motherboard via the 3.5mm cable bundle, or be used with the CM Storm Tactical Mixing Console with dual USB plugs.

The Tactical Mixing Console features an integrated 7.1 USB soundcard, allowing you to adjust everything on-the-fly without leaving the game or movie and accessing the Windows or Soundcard Driver panel.

Operation

- A. True 5.1 Surround Sound, 4 speakers on each side!
- B. On-The-Fly Bass, Rear, Front and Center channel control for maximum sound customization.
- C. Interchangeable circumaural weaved and leatherette ear-cups
- D. Microphone with LED mute indicator
- E. Dual gold-plated USB Connectors for maximum bass boost

Tactical Mixing Console

Besides the Mute and Mic Mute buttons, you can adjust not only the master volume but fine tune the volume of each separate surround channel individually.

Volume Control

This huge high-grade volume knob lets you finetune each audio channel and the overall volume of Sirius in great detail. It's resistive enough to prevent volume hikes by accidental sliding over the knob with your hand or elbow. Your ears will thank us.

Mute

This button lets you mute Sirius with the click of a button, in case you have to escape the realms of game for a quick IRL chat or phone call, and lets you toggle right back into the fun by pushing it again.

Mic Mute

At the press of this button it will light up in red and your mic will turn off in an instant allowing you to discuss sensitive details with your team mates sitting next to you.

Advanced

Use this button to fine tune individual channels to create a deadly FPS profile giving you superhuman in-game sound perception or an incredibly immersive universe of surround sound tailored to your favorite game or movie.

Tactical Mixing Console

Master

The master channel adjusts the volume of all channels simultaneously, keeping the fine-tuned balance between the channels. Use this to tune out background noise in your room and get into the game or movie.

Center

The center channel is commonly used for everything happening right in front of you, your mic shouts, steps and gunfire, and very useful in FPS games! Provided the game supports it, you can adjust this channel to tune out your own steps and gunfire to better focus on surround sounds, like an opponent sneaking around the corner.

Front

The front channel controls the volume of the front left and front right channel – on a stereo headset this would be all you'd hear. While the additional channel on Sirius make a big difference, this channel is the most important as all the crucial action going on around you in-game will likely be to your front-left or front-right.

Rear

The rear channel controls the volume of the rear speakers in Sirius. This channel is crucial to create immersive surround sound that puts you in the center of the action.

Bass

The bass uses its own separate channel, so you can tune out loud deep sounds such as explosions to focus on what else is going on, or amplify it and get blown away by the action and become one with the game.

Storm Tactical Driver Panel

■ Default Windows Audio Device

When Windows detects several playback (headset, speakers) and recording devices (mics) you can choose to enable or disable them separately.

Sirus will automatically be detected as default Audio and Recording device as soon as you connect it. This tab of the Tactical Driver Interface lets you quickly switch between Sirus and your Speaker System and define the default Devices windows uses for audio input and output in case you want to enable your speakers, but still use the mic built into Sirus.

■ SVN

SVN (Smart Volume Normalization) boosts the sound quality and bass strength by emphasizing certain frequency ranges.

■ **Advanced sub-menus**

Right clicking on the Speaker or Mic Logo brings up an advanced menu that lets you browse through different feature tabs and configure the Speakers and Mic

■ Information Panel

1. Playback (Speaker Out)

Displays the current default audio output device.

2. Capture (Mic In, Line-in)

Displays the current default audio input device.

3. Speaker Numbers (2/ 4/ 5.1)

Displays the currently active speaker configuration.

4. Sample Rate

Displays the playback sample rate for the current default audio output device.

5. Out

Displays currently active sound modulation and sound boost effects.

Abbreviation	Sound Effect
EQ	Enquirer
EM	Reverb
VSS	Virtual speaker shifter
FB	FlexBass / FlexBass II

6. In

Displays whether audio input (mic) effects are enabled

Abbreviation	Sound Effect
SF	Xear SingFX

■ Profile Panel

You can switch between preset configuration profiles and your own custom profile

1. Add Profile:

User adjusts specific sound effects (Ex: EQ, EM etc...) and click this add profile button to name and create a user-define mode.

2. Delete Profile:

This deletes the custom user profile, the default profile can not be deleted

3. Switch Button:

This button allows you to switch between the Information Panel and the User Profile Panel

■ Speaker Feature Panels

Volume control Page

Lift/ Right Channel Lock:

By default the left and right signals for each respective audio channel are locked

If you want, you can un-lock them and configure them seperately from each other to balance out a slight hearing impairment on one ear for example

■ Speaker Settings

Speaker Mode

You can switch between stereo, quadrophonic or 5.1 mode and test each audio channel by clicking on the playback button

Surround Max (Virtual Surround Sound)

Creates virtual surround sound by interpreting and modulating the audio stream.

If a game or movie features stereo sound only, you can use this feature to make use of all 8 drivers in Sirius. It will create some pseudo surround effects but most notably boost the audio volume by using all available channels and not only 2 (stereo)

■ Equalizer Page

This 10 band EQ Panel allows you to manually adjust and modulate the audio stream to match your personal preferences. You can switch between predefined profiles or create custom profiles for movies, music and different games.

■ Sound Effect Page

Environmental Effects:

There are several fun-modes that simulate sound reflection and reverberation. If you ever get bored, try your favorite games in some of these modes for some fun.

Room Size:

Besides the fun modes there are 3 separate modes that slightly adjust sound reflection and reverberation to emulate a different room size.

■ **Virtual Speaker Shifting**

Auto Rotation Mode:

This makes all speakers slowly rotate around you

Manual Rotation Mode:

In this mode you can use your mouse to slowly rotate the speakers

Manual Positioning:

In this mode you can drag and drop any of the speakers to any desired virtual location which will modulate the sound coming from it.

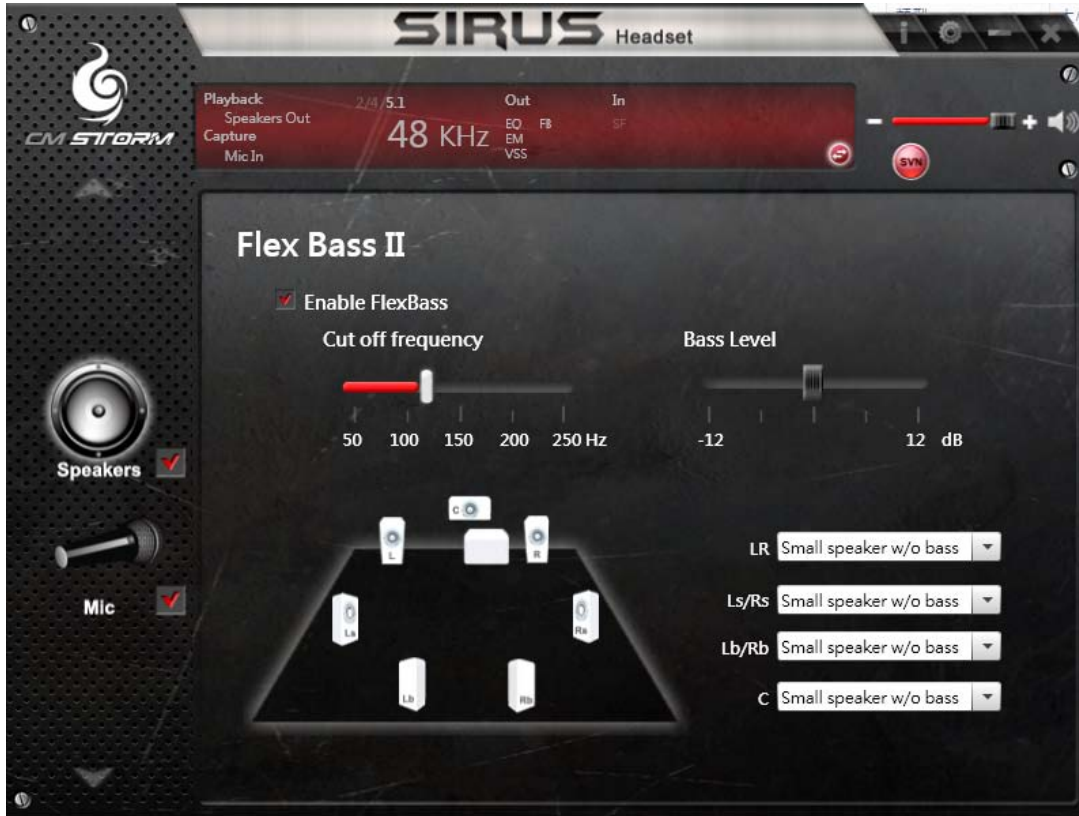

Reset:

Reset all speakers to their default location and configuration

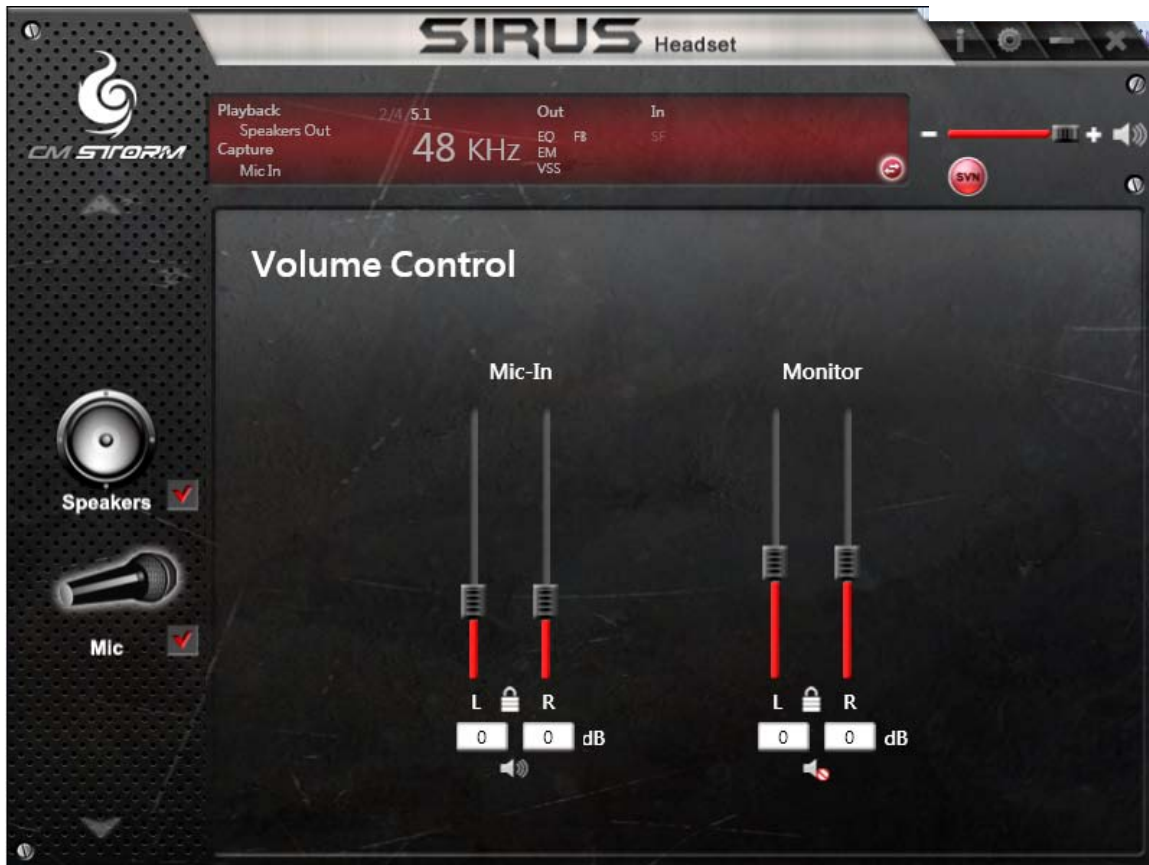

■ Flex Bass II

Flex Bass allows you to emphasize and boosts the subwoofer channel, but as the name suggests it's not an on and off bass boost like on oh so many audio systems but gives you a lot of flexibility to fine tune the bass to your likes.

■ Microphone Features

Volume control

Just like for the speakers there is a volume panel for the MIC as well to either mute it or adjust its sensitivity. Try different settings until you find a sweet spot of high enough sensitivity and low background noise and white noise.

Volume control bar:

Monitor Vol. - It provides Monitor volume level adjusting of Mic-IN device.

■ Advanced Settings

Show System Tray Icon

If you check this option there will be a system tray icon displayed in the Windows task bar which allows you to quickly bring up the Driver Panel by double clicking on it.

UI Transparency

You can adjust the transparency of the Window; this is a purely cosmetic thing to make the driver panel blend in with windows Aero Glass.
